

Fluids

PRE-SEED INVESTOR OVERVIEW

The product family hiding inside bloodwork.

Fluids ran our model across NHANES to turn routine labs into nutrient vectors, standard function blends, and personalized daily drink mixes.

NHANES-informed whole-food drink mix

Standard menu. Custom
upgrade.

Health data has outpaced nutrition.

Consumers can measure more than ever. But after a blood test, the daily action is still generic: supplement shelves, broad advice, and products that do not reflect the person in front of them.

The gap is turning health signal into a product someone can understand, drink, and repeat.

Current consumer journey

The nutrient vector is the interface.

A blood test should not map straight to a pill shelf. It should map to a nutrient direction, then to a product-realistic formula that can be made and used daily.

Biomarkers -> nutrient vector -> standard or custom blend

The model translates messy biomarker inputs into a formulation target that a consumer can actually act on.

Fluids

NUTRITION, CALIBRATED.

PRODUCT

Menu first. Custom with labs.

Fluids starts with an eight-blend function menu, then uses bloodwork to generate a personalized blend when someone wants the full custom experience.

Fluids

MULTI-TIER, CALIBRATED

ENGINE

We tested the engine as a real product system.

The first product is a drink mix. The bigger asset is the loop from labs to formula vectors.

Population proof

16,936 NHANES participants ran through the same product path.

Makeable formulas

Every blend stays inside real fruit, vegetable, mineral, and juice powder rails.

Our model

The model ranks nutrient directions and chooses the best blend path.

One product system

The standard menu and custom blends now use the same formula logic.

Fluids

MULTI-TIER, CALIBRATED

NHANES PROOF

The model discovered recurring product families.

Running the app across NHANES produced 16,406 successful personalized formulas that clustered into stable standard function lanes.

16,406

successful custom formulas

8 stable product families

cover 73.4%

8-blend fit
92.3%

Where the Population Lands

Survey-weighted share of successful VFD personalized formulas

Consumers want science-backed wellness they can actually use.

At-home labs, wearables, longevity culture, and supplement fatigue are converging around one expectation: personalized recommendations should become simple daily routines.

\$6.8T

global wellness economy in 2024;
forecast near \$9.8T by 2029

82%

of U.S. consumers consider wellness a
top or important priority

60.2%

of U.S. adults used a dietary supplement
in the past 30 days

A standard menu with custom-blend upside.

Standard function blends create a clear entry shelf. Lab uploads create the premium personalized product and the data loop that compounds.

Entry product	Standard box	Eight function blends make the menu easy to understand
Premium upgrade	Custom blend	Upload labs, generate vector, personalize formula
Partner channel	Lower CAC	Labs, clinicians, coaches, wellness platforms
Scale path	60%+ GM target	Shared ingredient rails improve COGS as standards and custom scale together

Why the menu matters

- Standards make the product easy to buy
- Custom gives the premium reason to upload labs
- Population families become repeatable SKUs
- Formula intelligence supports margin and retention

The moat is the formulation graph.

The advantage is the graph from biomarker pattern to nutrient vector, formula family, adherence, retest, and measured response.

Population map thesis

NHANES proves the map has structure before Fluids has proprietary response data.

Measured-response loop

Every customer cycle can sharpen the next recommendation and the next standard blend.

GO-TO-MARKET

Start where the signal already exists.

Fluids enters through people and partners already using biomarkers, while the standard menu makes the product simple to explain.

01

Founder-led cohort

Early believers pick a function blend or upload labs, drink daily, retest, and give feedback.

02

Biomarker partners

Labs, clinicians, coaches, and wellness platforms become lower-CAC distribution paths.

03

Replenishment

30-day boxes become repeat orders, standard-function cohorts, and personalized formulas.

The pilot answers adoption, reorder, and signal.

Will people use it?

Taste score, daily adherence, ease of routine

Will they buy again?

Standard reorder, custom upgrade, subscription interest

Is there a measurable signal?

Modeled direction, safety review, and biomarker movement after use

1

RAISE

\$500K gets Fluids to a seed-ready proof point.

The round funds the standard-function launch, custom-blend app, measured pilot, partner channel, and operating system needed to turn formulation into a platform.

12-month milestones

Eight-blend menu | custom blend demo | 25-50 person pilot | 1-2 platform partners | early reorder signal

Use of funds

\$150K	Standard blends, packaging + initial inventory
\$125K	Biomarker pilot + analysis
\$125K	Team, operations + custom app polish
\$100K	Regulatory, QA, partner launch + buffer

The model discovers the product families.

NHANES gave Fluids population-scale labs. Our model turned those labs into personalized formulas. The formulas showed us the standard functions, custom lanes, and operating forecasts.
